

Conditional Formatting, Nested IF & IFERROR

- * What is Conditional Formatting
- * Nested If
- * Logical Operators

Conditional Formatting & Logical Functions

Automate visual cues and build smart decision logic in your spreadsheets

Conditional Formatting

Automatically applies formatting (colors, icons, bars) to cells based on their values.

Purpose: Highlight trends, outliers, and key data points visually.

Example: Highlight cells red where Sales < 1000; green where Sales > 5000

Nested IF Statements

Multiple IF functions inside each other to test several conditions sequentially.

Syntax: =IF(condition1, result1, IF(condition2, result2, default))

Example: =IF(Score>=90,"A",IF(Score>=80,"B",IF(Score>=70,"C","F")))

Logical Operators (AND, OR, NOT)

Combine multiple conditions into a single TRUE/FALSE evaluation.

AND: =AND(A1>10, B1<50) - TRUE only if ALL conditions are met

OR: =OR(A1="Yes", B1="Yes") - TRUE if ANY condition is met

NOT: =NOT(A1="Cancelled") - reverses the logical value

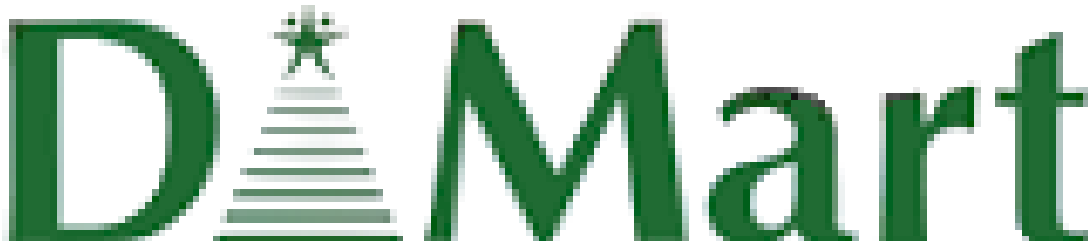

When to Use Each

Conditional Formatting = Visual alerts | Nested IF = Multi-outcome logic | AND/OR = Combined tests

Conditional Formatting: quick visual scanning of large datasets

Nested IF: grading, tiered pricing, category assignment

AND/OR/NOT: filtering, validation rules, complex criteria

IFERROR Function & Best Practices

What is IFERROR?

Catches errors in formulas and returns a custom value instead of an error message.
Syntax: =IFERROR(value, value_if_error)

Common Use Cases

=IFERROR(VLOOKUP(A1,Data,2,0), "Not Found") - handles missing lookup values
=IFERROR(B1/C1, 0) - prevents #DIV/0! errors in calculations

Combining IFERROR with Nested IF

=IFERROR(IF(Score>=90,"A",IF(Score>=80,"B","C")), "Invalid")

Wrapping Nested IF in IFERROR catches unexpected data types or blank cells.

Best Practices

Use IFERROR at the outermost layer to catch all nested errors.
Avoid hiding meaningful errors - use specific fallback values, not blanks.

When to Use Each Function

Conditional Formatting => Visual data scanning and alerts
Nested IF => Multi-tier classification and grading
AND/OR/NOT => Complex multi-condition logic

Key Takeaway

IFERROR makes formulas robust. Pair it with Nested IF and Logical Operators to build error-proof, multi-condition decision logic in any spreadsheet.
